

Dashboard Overview 3

This dashboard shows the hospital’s overload situation after applying a filter on total admissions. It explains how a lower patient inflow impacts waiting time, overload risk, and operational delays in the Emergency department. The charts illustrate admission trends over time, changes in triage and registration delays, and how overload risk is distributed across different months. The summary cards highlight the current overload status, the predicted risk for the next day, and the average triage time, helping hospital staff quickly understand system performance under reduced patient load.

Example:

When patient admissions are low, waiting times remain controlled and the system mostly indicates low or medium overload risk, showing that the Emergency department is operating under stable conditions without immediate pressure.
