

## Dashboard Overview 2

This dashboard shows the hospital's overload situation after applying a filter on **total admissions**. It highlights how a specific admission level affects waiting time, overload risk, and operational delays in the Emergency department. The charts show admission trends over time, changes in triage and registration delays, and how overload risk is distributed across months. The summary cards display the **current overload status**, **tomorrow's predicted risk**, and the **average triage time**, helping hospital staff quickly understand the impact of the selected admission level.

### Example:

If total admissions are fixed at a specific value and the average triage time still increases, the dashboard can indicate a **medium or high overload risk**, showing that congestion is caused by operational delays rather than patient volume alone.
