Dashboard Overview 1

This dashboard provides a quick view of how patient admissions and waiting times impact overload risk in the hospital's Emergency department. It shows admission trends over time, the relationship between patient volume and triage waiting time, and how often the hospital experiences low, medium, or high overload risk across different months. Summary cards highlight today's current overload status and the predicted risk for the next day, helping in short-term planning.

Example:

If admissions remain normal but discharge rates slow down, waiting times may increase, and the system can still flag a **medium or high overload risk**, allowing hospital staff to adjust schedules or manage patient flow early.
